Project Statement:

In a world where convenience is paramount, passengers often seek a hassle-free means to book tickets and gather essential information about train schedules. Our project aims to provide a seamless solution, empowering passengers to effortlessly book tickets and access comprehensive details about trains—all within a single click.

Importance of the DataBase:

This database serves as a fundamental tool for passengers, streamlining the ticket booking process and providing essential details. Passengers can easily access information about ticket prices and utilize various payment methods such as Visa or Fawry the database empowers passengers to make informed choices by offering insights into train details, including train numbers, available classes (e.g., air conditioner or normal), and arrival times at specific stations.

Beyond passenger convenience, the database help You to know manager that manage specific station and address and the station name that will the train start from it and stop from it .

Requirements

Design a database to keep track of information for a “Railway Reservation System”

that the following requirement were collected :

- i. Each **passenger** has a unique passenger_id , name(F_name,M_name and L_name) ,phone,address and sex,passenger who book the ticket .
- ii. Each **ticket** has a unique ticket_on,price , date and number of ticket have reserved.
- iii. The **train** has a unique train_on , station_end , dep_time ,class , arr_time no_of_seats and station_start.
- iv. The train go from many stations.
- v. The **station** has a unique station_code, station_name and address .
- vi. The passenger relat ticket by **PAY** has a pay_method and total_price .
- vii. Each **employee** has a unique ssn ,name(F_name ,M_name ,L_name) , sex , address and phone.
- viii. ticket belongs to by one train.
- ix. The employee can manage one station
